

# Package ‘aws.wrfsmn’

February 7, 2025

**Type** Package

**Title** Data Processing of SMN Hi-Res Weather Forecast from 'AWS'

**Version** 0.0.5

**Description** Exploration of Weather Research & Forecasting ('WRF') Model data of Servicio Meteorologico Nacional (SMN) from Amazon Web Services (<<https://registry.opendata.aws/smn-ar-wrf-dataset/>>) cloud. The package provides the possibility of data downloading, processing and correction methods. It also has map management and series exploration of available meteorological variables of 'WRF' forecast.

**License** GPL (>= 3)

**Depends** R (>= 4.1.0)

**Imports** aws.s3 (>= 0.3.21), lubridate (>= 1.9.3), terra (>= 1.7-65),  
dplyr (>= 1.1.4), ggplot2 (>= 3.4.4), hydroGOF (>= 0.5-4),  
stats (>= 4.1.2), magrittr (>= 2.0.3)

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.3.2

**Suggests** knitr, rmarkdown, testthat (>= 3.0.0)

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** Gonzalo Diaz [cre, aut]

**Maintainer** Gonzalo Diaz <gonzalomartindiaz22@gmail.com>

**Repository** CRAN

**Date/Publication** 2025-02-06 23:30:02 UTC

<b>Index</b>	<b>9</b>
--------------	----------

---

daily.data.fields	<i>Daily data is obtained from hourly data</i>
-------------------	--

---

### Description

....

### Usage

```
daily.data.fields(raster.list, aggregate)
```

### Arguments

raster.list	Spat Raster variable with several times for a unique variable (T2 or HR2 or ...)
aggregate	Type of aggregation (sum, mean, min, max)

### Value

Spat Raster with daily information

---

eva	<i>Evaporation data (observation and model)</i>
-----	---

---

### Description

Data of evaporation from in-situ observation and several soil model outputs

### Usage

```
data(eva)
```

### **Format**

An object of class "data.frame".

**Dates** 1st column with dates

**evapo\_obs** 2nd column with evaporation observation

**OUT\_PREC** Precipitation

**OUT\_EVAP** Evaporation

**OUT\_RUNOFF** Runoff

**OUT\_BASEFLOW** Baseflow

**OUT\_SOIL\_MOIST\_1yr\_1** Soil moisture from 1st layer

**OUT\_EVAP\_CANOP** Evaporation from canopy

**OUT\_SURF\_TEMP** Surface temperature

### **References**

Diaz et al. (2024) AAGG 2024 Not yet published

### **Examples**

```
data(eva)
```

---

`find.nearest.point`      *Temporal series of closest location*

---

### **Description**

Location of nearest point to lon/lat and temporal serie of location

### **Usage**

```
find.nearest.point(data.spat.raster = data.spat.raster, lon = lon, lat = lat)
```

### **Arguments**

`data.spat.raster`      Spat Raster of WRF SMN (only one or several)  
`lon`                      Longitude location of nearest point to find  
`lat`                      Latitude location of nearest point to find

### **Value**

a vector with the nearest location (lon/lat) and time serie of that location

---

<code>get.wrf.files</code>	<i>List of available files for downloading</i>
----------------------------	--

---

### Description

Character string with the filenames of WRF SMN located in AWS Bucket

### Usage

```
get.wrf.files(year = year, month = month, day = day, cycle = cycle, time = time)
```

### Arguments

<code>year</code>	character or numeric of year
<code>month</code>	character or numeric of month
<code>day</code>	character or numeric of day
<code>cycle</code>	cycle of forecast, "00", "06", "12" or "18"
<code>time</code>	selection of datasets, "01H", "24H" or "10M"

### Value

string of the list of elements in the Bucket

---

<code>ith</code>	<i>Calculation of ITH index</i>
------------------	---------------------------------

---

### Description

ITH index calculation is made from gridded observational or model data. If the data is needed in lat/lon projection is better to use first the `load.by.variable` function to change projection

The index is calculated as:

$$ITH = 1.8 * T(C) + 32 - (((0.55 - (0.55 * RelHum(\%)))/100) * ((1.8 * T(C)) - 26))$$

where  $T(^{\circ}C)$  is the temperature in celsius degrees and  $RelHum(\%)$  is the relative humidity in percentage

### Usage

```
ith(raster.list = raster.list)
```

**Arguments**

raster.list      Spat Raster variable with several variables and times or only one Spat Raster field

**Value**

Spat Raster with ITH calculation for each time

---

load.by.variable      *Load and projection of data*

---

**Description**

Open of netcdf files of WRF SMN from AWS and optional projection

**Usage**

```
load.by.variable(nc.fileNames, variable, transform, method)
```

**Arguments**

nc.fileNames      netcdf files

variable            name of variable from [https://odp-aws-smn.github.io/documentation\\_wrf\\_det/Formato\\_de\\_datos/](https://odp-aws-smn.github.io/documentation_wrf_det/Formato_de_datos/) as character

transform           TRUE to project data to longlat datum=WGS84

method              if transform is set TRUE define projection method taken from project function of terra package

**Value**

Spat Raster with the chosen variable (optional: with the projection changed)

---

mg.evaluation      *Evaluation of regression*

---

**Description**

Evaluation of the linear multiple regression obtained from the multiple.guidance function

**Usage**

```
mg.evaluation(
  input.data = input.data,
  predictand = predictand,
  predictors = predictors,
  var.model = var.model,
  lmodel = lmodel
)
```

**Arguments**

input.data	Data frame with first column as a "POSIXct" class and one or more columns with data values. The predictand and predictors variables should be located in these columns
predictand	Character with column name of the predictand variable
predictors	Character array with one or more elements of the predictors chosen by the user
var.model	Character with column name of the modeled predicting variable
lmodel	Element of class lm obtained from multiple.guidance output function

**Value**

List of two elements. First element is a matrix with the columns of observed data, modeled data and corrected data. Second element is a data frame of the statistical results of the modeled and corrected data versus observed data

---

multiple.guidance	<i>Multiple lineal regression of data</i>
-------------------	---

---

**Description**

Definition of linear multiple regression adjustment based on predictor variables that fit a predicting variable

**Usage**

```
multiple.guidance(
  input.data = input.data,
  predictand = predictand,
  predictors = predictors
)
```

**Arguments**

input.data	Data frame with first column as a "POSIXct" class and one or more columns with data values. The predictand and predictors variables should be located in these columns
predictand	Character with column name of the predictand variable
predictors	Character array with one or more elements of the predictors chosen by the user

**Value**

an element of class `lm`

---

ploting

*Plot of data*

---

**Description**

Plot of observed, modeled and corrected guidance series

**Usage**

```
ploting(data = data)
```

**Arguments**

`data` Data frame from `daily2monthly` output function or any other temporal series

**Value**

ggplot element

---

wrf.download

*Download of wrf files*

---

**Description**

Download of WRF SMN data from AWS

**Usage**

```
wrf.download(wrf.name = wrf.name)
```

**Arguments**

`wrf.name` list of names to download from `get.wrf.files`. e.g.: "DATA/WRF/DET/2024/01/01/18/WRFDETAR\_24H\_

**Value**

downloaded netcdf files

---

%>%

*Daily data to monthly*

---

**Description**

Data transformation from daily to monthly scale

**Usage**

```
daily2monthly(data = data)
```

**Arguments**

data                   matrix with daily data from mg.evaluation output function

**Value**

Data frame with monthly data
