**Type** Package

**Title** Joint Modeling of Longitudinal and Survival Data - Power Calculation

**Version** 1.6

**Date** 2025-05-03

**Author** Emil A. Cornea [aut],  
Liddy M. Chen [aut],  
Bahjat F. Qaqish [aut],  
Haitao Chu [aut],  
Joseph G. Ibrahim [aut],  
Shannon T. Holloway [cre]

**Maintainer** Shannon T. Holloway <shannon.t.holloway@gmail.com>

**Description** Performs power calculations for joint modeling of longitudinal and survival data with k-th order trajectories when the variance-covariance matrix, Sigma\_theta, is unknown.

**License** GPL-2

**Depends** methods

**Encoding** UTF-8

**NeedsCompilation** no

**RoxygenNote** 7.2.1

**Repository** CRAN

**powerLongSurv**

*Power calculation in joint modeling of longitudinal and survival data  
- k-th Order Trajectories and Unknown Sigma*

## Description

Compute the power in joint modeling of longitudinal and survival data when the variance-covariance matrix Sigma\_Theta is unknown and the trajectories are order k.

The function computes power for a one-sided test, either

$$H_0 : \beta = 0 \quad \text{and} \quad H_{1A} : \beta > 0$$

or

$$H_0 : \beta = 0 \quad \text{and} \quad H_{1B} : \beta < 0$$

with Type I error  $\alpha$ . The choice of the alternative is determined by the sign of  $\beta$ . Negative values for  $\beta$  indicate that the alternative hypothesis is  $H_{1B}$ , while  $\beta \geq 0$  indicates that it is  $H_{1A}$ .

It creates a **powerLongSurv** object.

## Usage

```
powerLongSurv(
  N,
  nevents,
  tmedian,
  meantf,
  p,
  t,
  SigmaTheta,
  sigmae_2,
  ordtraj,
  beta = 0,
  alpha = 0.05,
  tol = 1.5e-08
)
```

## Arguments

<b>N</b>	numeric specifying the total sample size; minimum 20.
<b>nevents</b>	numeric specifying the number of events; at least 20 and at most N.
<b>tmedian</b>	numeric specifying the median survival time; positive
<b>meantf</b>	numeric specifying the mean follow-up time; positive and no greater than max(t).
<b>p</b>	numeric vector of estimated subject proportions with 2,3,... measurements, respectively, zero proportions allowed.
<b>t</b>	numeric vector of measurement times, distinct positive components; same length as p.

SigmaTheta	numeric matrix specifying the covariance matrix Sigma_Theta
sigmae_2	numeric specifying the measurement error; positive.
ordtraj	integer specifying the order of trajectories, must be less the order of Sigma_Theta
beta	numeric specifying the effect of the trajectory; default value 0.
alpha	numeric, strictly between 0.0 and 1.0, specifying the Type-I Error (2-sided), default value 0.05.
tol	numeric, For floating point objects x and y, if  x-y  <= tol, x==y. Passed to R function all.equal.

## Details

The function powerLongSurv is used to calculate the power in joint modeling of longitudinal and survival data.

## Value

An object of S4 class powerLongSurv, which has the following 12 components

title	character string
subtitle	character string
t	numeric vector
p	numeric vector
N	integer
nevents	integer
censr	numeric
tmedian	numeric
meantf	numeric
SigmaTheta	numeric matrix
ordtraj	integer
BSigma	numeric matrix
beta	numeric
alpha	numeric
power	numeric

**Examples**

```

## Example 1.

## *****
## Input elements of Sigma_theta in formula 4.6;
SigmaTheta <- matrix(c(1.2,0.0,0.0,0.0,0.7,0.0,0.0,0.0,0.8),nrow=3,ncol=3)

N      <- 200; # Total sample size;
nevents <- 140; # Number of events;
tmedian <- 0.7; # median survival;
meantf <- 1.4; # mean follow-up time;
beta    <- 0.2; # Effect of the trajectory;
alpha   <- 0.05;# Type-I Error (2-sided);
sigmae_2 <- 0.09; # measurement error;

## schedule of measurement;
t <- c(0.4, 0.8, 1.2, 1.6, 2) ; # maximum 2 year follow-up;

## Input estimated proportion subjects with 2,3,4,5,6 measurements;
## This is \xi in formula 4.6;
## The data is obtained from the simulated data for the calculation in table 2;
p <- c(0.3, 0.4, 0.15, 0.1, 0.05);

## Input the order of trajectories
ordtraj <- 1 ## linear trajectories

## Call function
## Linear Trajectories
pLS1 <- powerLongSurv(N, nevents, tmedian, meantf, p, t, SigmaTheta,
                      sigmae_2, ordtraj, beta, alpha=0.05)
pLS1
show(pLS1)
unclass(pLS1)

## Constant Trajectories
powerLongSurv(N, nevents, tmedian, meantf, p, t, SigmaTheta, sigmae_2,
               ordtraj=0, beta, alpha=0.05)

## Quadratic Trajectories
powerLongSurv(N, nevents, tmedian, meantf, p, t, SigmaTheta, sigmae_2,
               ordtraj=2, beta, alpha=0.05)

## *****

## Example 2.
## *****
## Input elements of Sigma_theta in formula 4.6;
SigmaTheta <- matrix(c(1.2,0.0,0.0,0.0,0.7,0.0,0.0,0.0,0.8),nrow=3,ncol=3)
```

```

## Input the order of trajectories
ordtraj <- 2 ## quadratic trajectories

## Call function
## Quadratic Trajectories
pLSq <- powerLongSurv(N,nevents,tmedian,meantf,p,t,SigmaTheta,sigmae_2,ordtraj,beta, alpha = 0.05)
pLSq
show(pLSq)
unclass(pLSq)

## Constant Trajectories
powerLongSurv(N, nevents, tmedian, meantf, p, t, SigmaTheta, sigmae_2,
               ordtraj=0, beta, alpha=0.05)

## Linear Trajectories
powerLongSurv(N, nevents, tmedian, meantf, p, t, SigmaTheta, sigmae_2,
               ordtraj=1, beta, alpha=0.05)

```

powerLongSurv-class     *Class "powerLongSurv"*

## Description

Class of objects like the output of function "powerLongSurv()".

## Slots

- title Object of class "character"
- subtitle Object of class "character"
- t Object of class "vector"
- p Object of class "vector"
- N Object of class "integer"

```

nevents Object of class "integer"
censr Object of class "numeric"
tmedian Object of class "numeric"
meantf Object of class "numeric"
SigmaTheta Object of class "matrix"
ordtraj Object of class "integer"
BSigma Object of class "matrix"
beta Object of class "numeric"
alpha Object of class "numeric"
power Object of class "numeric"

```

### Objects from the Class

Objects can be created by calls of the form `new("powerLongSurv", ...)`.

### Author(s)

Emil A. Cornea, Liddy M. Chen, Bahjat F. Qaqish, Haitao Chu, and Joseph G. Ibrahim

### See Also

### Examples

```
showClass("powerLongSurv")
```

*show, powerLongSurv-method*

*Methods for Function show*

### Description

Methods for function `show`

### Usage

```
## S4 method for signature 'powerLongSurv'
show(object)
```

### Arguments

object	An object of class <code>powerLongSurv</code>
