

Package ‘lddmm’

January 17, 2024

Type Package

Title Longitudinal Drift-Diffusion Mixed Models (LDDMM)

Version 0.4.2

Date 2024-01-17

Description Implementation of the drift-diffusion mixed model for category learning as described in Paulon et al. (2021) <[doi:10.1080/01621459.2020.1801448](https://doi.org/10.1080/01621459.2020.1801448)>.

Depends R (>= 4.1.0)

Language en-US

License MIT + file LICENSE

Encoding UTF-8

Imports Rcpp (>= 1.0.6), gtools, LaplacesDemon, dplyr, plyr, tidyr,
ggplot2, latex2exp, reshape2, RColorBrewer

LazyData true

LinkingTo Rcpp, RcppArmadillo, RcppProgress, rgen

RoxygenNote 7.2.3

Suggests rmarkdown, knitr

VignetteBuilder knitr

NeedsCompilation yes

B_basis	<i>Spline Basis Functions</i>
---------	-------------------------------

Description

Construct the J basis functions for the splines evaluated on a grid.

Usage

```
B_basis(xgrid, knots)
```

Arguments

xgrid	grid where we want to evaluate the spline functions (vector of length n)
knots	vector of knots for the splines (vector of length K)

Value

n x (K+1) - matrix representing the value of each basis function evaluated on xgrid

compute_WAIC	<i>Calculate WAIC</i>
--------------	-----------------------

Description

Function to compute the Watanabe-Akaike information criterion (Gelman, Hwang, Vehtari, 2014), which estimates the expected out-of-sample-prediction error using a bias-corrected adjustment of within-sample error.

Usage

```
compute_WAIC(model_fit)
```

Arguments

`model_fit` results of a model fit from the lddmm function

Value

A scalar indicating the WAIC (smaller WAIC denotes better fit)

data

Example dataset

Description

A toy dataset in the correct format for the LDDMM function call. This dataset has two possible response categories.

Usage

`data`

Format

A data frame with 24,254 rows and 6 columns

Details

- `subject`: vector of size n containing the participant labels
- `block`: vector of size n containing the training blocks (longitudinal units)
- `s`: vector of size n containing the stimuli
- `d`: vector of size n containing the decisions
- `r_time`: vector of size n containing the response times (log transformed)
- `cens`: vector of size n containing the censoring indicators (1 censored, 0 non censored)

`extract_post_draws`

Parameter posterior draws

Description

Function to extract the posterior draws of the parameters of interest from a lddmm fit object.

Usage

`extract_post_draws(data, fit, par = c("drift", "boundary"))`

Arguments

data	dataframe with the following columns:
	<ul style="list-style-type: none"> • subject: vector of size n containing the participant labels • block: vector of size n containing the training blocks (longitudinal units) • s: vector of size n containing the stimuli • d: vector of size n containing the decisions • r_time: vector of size n containing the response times • cens: vector of size n containing the censoring indicators (1 censored, 0 non censored)
fit	fit from the lddmm function
par	parameter to output ('drift', or 'boundary')

Value

Matrix with the following columns:

- subject: participant labels
- block: training blocks
- draw: iteration of the MCMC estimates
- par_s_d, ...: posterior draws for the requested parameters

extract_post_mean *Parameter posterior means*

Description

Function to extract the posterior means of the parameters of interest from a lddmm fit object.

Usage

```
extract_post_mean(data, fit, par = c("drift", "boundary"))
```

Arguments

data	dataframe with the following columns:
	<ul style="list-style-type: none"> • subject: vector of size n containing the participant labels • block: vector of size n containing the training blocks (longitudinal units) • s: vector of size n containing the stimuli • d: vector of size n containing the decisions • r_time: vector of size n containing the response times • cens: vector of size n containing the censoring indicators (1 censored, 0 non censored)
fit	fit from the lddmm function
par	parameter to output ('drift', or 'boundary')

Value

Matrix with the following columns:

- subject: participant labels
- block: training blocks
- par_s_d, ...: posterior means for the requested parameters

<code>H_ball</code>	<i>Hamming Ball</i>
---------------------	---------------------

Description

Computes the Hamming Ball centered at x with radius r.

Usage

```
H_ball(x, S, r)
```

Arguments

- | | |
|----------------|----------------------------|
| <code>x</code> | center of the Hamming Ball |
| <code>S</code> | number of states |
| <code>r</code> | radius of the Hamming Ball |

Value

Hamming Ball

<code>LDDMM</code>	<i>Drift Diffusion Model Fit</i>
--------------------	----------------------------------

Description

Main function for the Gibbs sampler for the drift-diffusion model. Note that priors are noninformative and calibrated so that, for the most stable performance, the response times (variable `r_time` in the `data` datafram) should lie between 0 and 10.

Usage

```
LDDMM(  
  data,  
  hypers,  
  cluster = TRUE,  
  boundaries = "flexible",  
  Niter = 5000,  
  burnin = 2000,  
  thin = 5  
)
```

Arguments

<code>data</code>	dataframe with the following columns:
	<ul style="list-style-type: none"> • <code>subject</code>: vector of size n containing the participant labels • <code>block</code>: vector of size n containing the training blocks (longitudinal units) • <code>s</code>: vector of size n containing the stimuli • <code>d</code>: vector of size n containing the decisions • <code>r_time</code>: vector of size n containing the response times. To avoid numerical issues, the unit of measurement should be such that the numerical values of most response times should lie between 0 and 10 • <code>cens</code>: vector of size n containing the censoring indicators (1 censored, 0 non censored)
<code>hypers</code>	hyperparameters of the MCMC: list containing " <code>s_sigma_mu</code> " and " <code>s_sigma_b</code> ", which are the smoothness parameters for drifts and boundaries, respectively)
<code>cluster</code>	should clustering be used? (default = TRUE)
<code>boundaries</code>	whether to fit the unrestricted model (flexible), assume constant boundaries over time (constant) or fix the boundaries to the same level across predictors (fixed)
<code>Niter</code>	total number of iterations
<code>burnin</code>	burnin of the chain
<code>thin</code>	thinning factor

Value

List with the following MCMC posterior samples:

- `post_mean_delta`: posterior samples for the population offset parameters
- `post_mean_mu`: posterior samples for the population drift parameters
- `post_mean_b`: posterior samples for the population boundary parameters
- `post_ind_delta`: posterior samples for the individual offset parameters
- `post_ind_mu`: posterior samples for the individual drift parameters
- `post_ind_b`: posterior samples for the individual boundary parameters
- `sigma2_mu_us`: posterior samples for the random effects drift smoothness parameters
- `sigma2_mu_ua`: posterior samples for the random effects drift variance parameters
- `sigma2_b_us`: posterior samples for the random effects boundary smoothness parameters
- `sigma2_b_ua`: posterior samples for the random effects boundary variance parameters
- `sigma2_1_mu`: posterior samples for the drift smoothness parameters
- `sigma2_1_b`: posterior samples for the boundary smoothness parameters
- `pred_ans`: predicted population-level categories
- `pred_time`: predicted population-level response times
- `pred_ans_ind`: predicted individual-level categories
- `pred_time_ind`: predicted individual-level response times

<code>log_likelihood</code>	<i>Log-likelihood computation</i>
-----------------------------	-----------------------------------

Description

Compute the log-likelihood for the drift-diffusion model, including the censored data contribution.

Usage

```
log_likelihood(tau, mu, b, delta, cens, D, log)
```

Arguments

<code>tau</code>	vector of size n containing the response times
<code>mu</code>	matrix of size (n x d1) containing the drift parameters corresponding to the n response times for each possible d1 decision
<code>b</code>	matrix of size (n x d1) containing the boundary parameters corresponding to the n response times for each possible d1 decision
<code>delta</code>	vector of size n containing the offset parameters corresponding to the n response times
<code>cens</code>	vector of size n containing censoring indicators (1 censored, 0 not censored) corresponding to the n response times
<code>D</code>	(n x 2) matrix whose first column has the n input stimuli, and whose second column has the n decision categories
<code>log</code>	should the results be returned on the log scale?

<code>log_likelihood_ind</code>	<i>Log-likelihood computation for a single observation</i>
---------------------------------	--

Description

Compute the log-likelihood for the drift-diffusion model, including the censored data contribution, for a single observation.

Usage

```
log_likelihood_ind(tau, mu, b, delta, cens, D)
```

Arguments

<i>tau</i>	vector of size n containing the response times
<i>mu</i>	matrix of size (n x d1) containing the drift parameters corresponding to the n response times for each possible d1 decision
<i>b</i>	matrix of size (n x d1) containing the boundary parameters corresponding to the n response times for each possible d1 decision
<i>delta</i>	vector of size n containing the offset parameters corresponding to the n response times
<i>cens</i>	vector of size n containing censoring indicators (1 censored, 0 not censored) corresponding to the n response times
<i>D</i>	(n x 2) matrix whose first column has the n input stimuli, and whose second column has the n decision categories

*plot_accuracy**Descriptive plots***Description**

Plot the accuracy of the raw data.

Usage

```
plot_accuracy(data)
```

Arguments

<i>data</i>	dataframe with the following columns:
	<ul style="list-style-type: none"> • <i>subject</i>: vector of size n containing the participant labels • <i>block</i>: vector of size n containing the training blocks (longitudinal units) • <i>s</i>: vector of size n containing the stimuli • <i>d</i>: vector of size n containing the decisions • <i>r_time</i>: vector of size n containing the response times • <i>cens</i>: vector of size n containing the censoring indicators (1 censored, 0 non censored)

Value

Individual and population level raw accuracies

plot_post_pars	<i>Plot posterior estimates</i>
----------------	---------------------------------

Description

Function to plot the posterior mean and credible intervals of the parameters of interest from a lddmm fit object.

Usage

```
plot_post_pars(data, fit, par = c("drift", "boundary"))
```

Arguments

data	dataframe with the following columns:
	<ul style="list-style-type: none">• subject: vector of size n containing the participant labels• block: vector of size n containing the training blocks (longitudinal units)• s: vector of size n containing the stimuli• d: vector of size n containing the decisions• r_time: vector of size n containing the response times• cens: vector of size n containing the censoring indicators (1 censored, 0 non censored)
fit	fit from the lddmm function
par	parameter to output ('drift', or 'boundary')

Value

Posterior mean and 95% CI

plot_RT	<i>Descriptive plots</i>
---------	--------------------------

Description

Plot the mean response times of the raw data.

Usage

```
plot_RT(data)
```

Arguments

- data** dataframe with the following columns:
- subject: vector of size n containing the participant labels
 - block: vector of size n containing the training blocks (longitudinal units)
 - s: vector of size n containing the stimuli
 - d: vector of size n containing the decisions
 - r_time: vector of size n containing the response times
 - cens: vector of size n containing the censoring indicators (1 censored, 0 non censored)

Value

Population level raw response times

$P_{smooth1}$

Spline Penalty Matrix

Description

Construct the covariance matrix P of the smoothness inducing prior for the spline coefficients

Usage

$P_{smooth1}(K)$

Arguments

- K** Number of spline knots

Value

Covariance of the smoothness inducing prior (penalizing first differences in the spline coefficients)
